## **Foreword**

The project 'Views from the Frontline' is a follow up initiative of the Hyogo Framework for Action (HFA) that has been adopted by 168 governments in the world. The Hyogo Framework for Action identifies ways to build the resilience of nations and people to disaster, that by 2005 there will be a substantial reduction in disaster losses suffered by the people and communities in the world. It is highly expected that the impact of the HFA must be felt on the ground where people who are at-risk live, eat and work. Effective implementation of the HFA will require strong accountability, based on the ability to measure progress towards objectives.

The YAKKUM Emergency Unit as the National Coordinating Organization for Indonesia has reviewed HFA implementation in several regions, i.e.: Aceh, Nias, Central Java, East Java and Yogyakarta, the Moluccas and Ambon. These areas are chosen with consideration of their geographical conditions and disaster history.

The review of the HFA implementation has been conducted through a survey with three groups of respondents; i.e. Local Government officials, Civil Society Organizations and Community Representatives. The data collected was analyzed to measure progress and identify the success factors and challenges encountered during implementation. Seminars and workshops were held to facilitate dialogues among the community, civil society organizations, government, the private sector and the media. This events discussed the progress of disaster risk reduction initiatives in Indonesia; the roles of the government, NGOs and CBOs in the implementation of DRR; the method of mainstreaming disaster risk reduction programs to access government and private sector's budget (through corporate social responsibility); and the lessons learned from DRR programs in each region.

We realize that the accomplishment of this project is far from perfect, but we hope that the review that has involved many diverse stakeholders at the local level and done in a transparent manner could contribute significantly for all DRR stakeholders.

## **YAKKUM Emergency Unit (YEU)**

National Coordinating Organization Indonesia  
Hyogo Framework of Action Review Process

## **Acknowledgements**

The Hyogo Framework of Action review process could not be completed without the cooperation and supports from various stakeholders.

Special credit goes to Marcus C. Oxley, the Chairman of Global Network for Disaster Reduction, Terry Gibson and GN Secretariat team members for giving the opportunity for YEU to implement this project.

We sincerely thank Ninil R. Miftahul Jannah (Acting Chair of DRR Forum [*Forum PRB*] for 2007-2009) and Danang Samsurizal (Coordinator of DRR Forum for 2009-2012) who have been more than willing to serve as National Advisory Committee members for this survey "Views from the Frontline". The technical advice, insightful discussions and supports provided by members of the DRR Forum during the project implementation are greatly appreciated.

We would like also to express our sincerest appreciation to all our respondents from the local governments, civil society organizations and the public as well as the participants of our consultation sessions that have contributed their time to participate and support us, so that the review process could be conducted successfully.

Last but not least, the efforts of the YAKKUM Emergency Unit (YEU) staff members cannot be ignored. Special thank goes to all colleagues in the field who have assisted in the distribution of the questionnaires in their respective areas amidst the busy schedule, so that the data collection process could be done in a smooth manner. We hope that the process and the findings of the project may bring forth meaningful lessons for us.

Hepi Rahmawati  
Country Coordinator for Indonesia  
YAKKUM Emergency Unit

## List of Acronyms

### **CSO**

Civil Society Organizations. These can be international, national or local Non-Government Organizations and organizations that support program implementation (implementing partner). The overall profit and not-for-profit organizations are categorized as CSOs.

**DRR** stands for **Disaster Risk Reduction**

### **GN**

The Global Network of Civil Society Organizations for Disaster Reduction; a network of international civil society organization that implements advocacy for disaster risk reduction policies throughout the whole world

### **Global Platform – Disaster Risk Reduction (GP-DRR)**

The UN-ISDR periodic review process conducted every two years to report on progress towards implementation of the Hyogo Framework for Action

### **HFA**

The Hyogo Framework for Action – a framework for disaster risk reduction adopted by 168 countries at the World Conference on Disaster Reduction in 2005 in Hyogo, Japan. The Framework aims at building the resilience of nations and communities to disasters

### **NAC**

The National Advisory Committee. A committee consists of several stakeholders who voluntarily contribute their time, effort and advice to the review. The NAC for Indonesia is the DRR Forum (*Forum Pengurangan Risiko Bencana*).

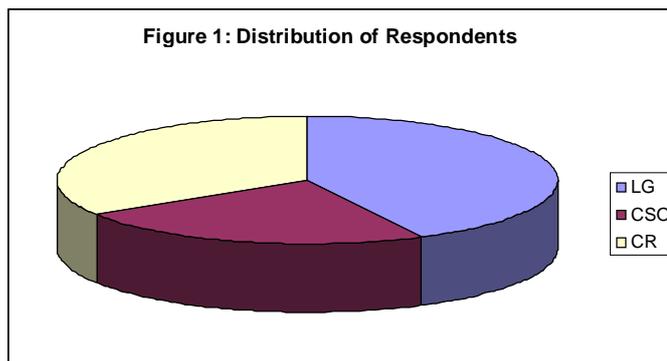

### **NCO**

The National Coordinating Organization. An organization tasked with implementing the project at the country level. YAKKUM Emergency Unit is the NCO for Indonesia.

## Executive Summary

In an effort to measure the progress of HFA at the local level across developing nations and regions, GN initiated an independent, participatory action research namely “Views from the Frontline” that would involve stakeholders from the local level. The overall findings of this research would be used as an alternative to enrich the review of HFA in the United Nations Global Platform for Disaster Risk Reduction that was held in June 2009.

YAKKUM Emergency Unit (YEU) was selected as the NCO to implement the “Views from the Frontline” survey in Indonesia. The areas for survey included Yogyakarta, Central Java, East Java, Aceh, and Nias; with 62 participants from government representatives, 34 from CSOs and 50 from community representatives. The number of areas and respondents were limited due to time and resource constraints. The survey was focused on disaster prone areas and communities living in these areas. It is interesting to note that the local governments participate more enthusiastically in this survey than civil society organizations.

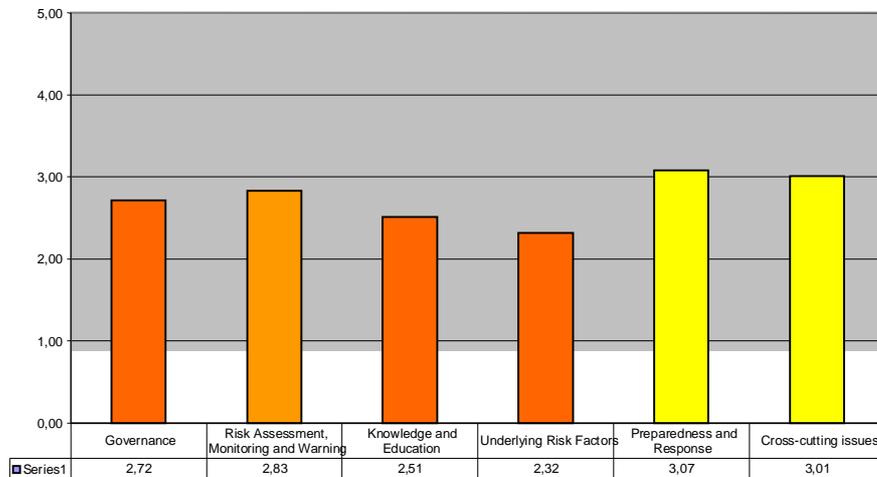

Notes:

- LG: Local Government
- CSO: Civil Society Organizations
- CR: Community Representatives

The target respondents were required to assess the existing condition of the HFA’s five Priorities within their locality and/or organization.

The results of the survey are as the following:

Figure 2: Overall Scores by Priority for Action

**Governance:**

The Law No. 24/2007 on Disaster Management has been launched and the National Agency for Disaster Management has been established. The Government has strong commitment to build disaster resilient nation and communities. However, a balance needs to be created between the regulations and their implementations. DRR perspectives and other key elements (cross-cutting issues, risks assessment, and underlying risks factors) need be integrated into all aspect of development and supported with sufficient budget and support facilities. For effective response in the future, standard mechanism for response needs to be formulated based on experiences of previous response.

**Risk Assessment, Monitoring and Warning:**

The government seems to have much homework in realizing the shift of paradigm from emergency response to disaster risk reduction. The government and CSOs need to engage the participation and contribution of the public in assessing and monitoring disaster risks. Results of risk assessment need to be verified and updated regularly to ensure validity. Effective and simple early warning system based on local wisdom should be developed and provided to reduce future risks.

**Knowledge and Education:**

CSOs should assist the government and community in raising awareness, enhancing education and building capacity for disaster risk reduction. Access to information for community and multi-stakeholders forum are absolute needs, and should be available. Common understanding of DRR and multi-stakeholders forum and collaborative efforts amongst government, CSOs and community for DRR education and raising awareness are needed as the foundation for disaster resilient community and nation. Contribution from the media to advocate communities’ efforts in recovery and disaster risk reduction is a key in boosting the spirit of disaster survivors.

***Underlying Risk Factors:***

Some underlying risks have been addressed by government but not yet integrated optimally in development planning and implementation. Many campaign and public awareness activities have been done by CSOs because they are faster in accessing and accepting new issues compared to the government, and also because their mandate is to empower the communities. Efforts to empower community, alleviate poverty and protect the economy can only be done with the full support of the government.

***Cross-cutting Issues:***

The government has had a strong commitment to give space for public participation and to provide information, but is still weak in implementation. CSOs have had strong local cultural sensitivity in their DRR initiatives so that they are well accepted by the community and the community in turn gives their feedback to CSOs. Social values are strongly used by community in social interaction, but there is still a challenge for the community to participate more actively in cross cutting issues.

***Conclusion:***

There has been a common understanding of DRR, a standard emergency response mechanism, multi-stakeholder DRR forums, efforts to mainstream DRR in all aspects of development, budget for DRR and support facilities, and there have also been collaborative efforts amongst the government, CSOs and community to build disaster resilient community and nation.

## **I. Views from the Frontline – Project Background and Approach**

In January 2005, in Kobe, Japan, 168 Member States of the United Nations adopted the Hyogo Framework for Action (HFA) which is a key framework for implementing disaster risk reduction within the overall goal of building the resilience of nations and communities to disasters. The HFA aims to achieve a substantial reduction of disaster losses by 2015 – both in lives, and in the social, economic, and environmental assets of communities and countries. To ensure the actual achievement of the expected results, the commitment and active participation of all relevant actors, including the government, regional and international organizations, the civil society, volunteers, academics and the private sector are indispensable.

The Hyogo Framework for Action 2005-2015 has three Strategic Goals and five Priorities for Action. The three Strategic Goals of HFA include the integration of disaster risk considerations into sustainable development policies, planning and programming; the development and strengthening of institutions, mechanisms and capacities to build resilience to hazards; and the systematic incorporation of risk reduction approaches into the design and implementation of emergency preparedness, response and recovery programmes. The five priorities of HFA are as the following:

1. Ensure that disaster risk reduction is a national and a local priority with a strong institutional basis for implementation
2. Identify, assess and monitor disaster risks and enhance early warning
3. Use knowledge, innovation and education to build a culture of safety and resilience at all levels
4. Reduce the underlying risk factors
5. Strengthen disaster preparedness for effective response at all levels

To measure the progress in the implementation of the Hyogo Framework for Action, some time ago YEU, together with the other members of the Global Network conducted a survey 'Views from the Frontline'. It is an action-research project that aims to measure progress towards the implementation of the HFA at the local level. The survey findings will provide a different, yet complementary perspective to the UN-ISDR coordinated monitoring process, which will review progress on the HFA primarily at the national level and from a top-down governmental perspective.

Together these two assessments (the 'Views from the Frontline' and the HFA monitor tool) should provide a clear picture of the progress and challenges in the implementation of disaster risk reduction activities as defined within the Hyogo Framework Priorities for Action. The analysis of the project will be focused on the key challenges and issues that have impact on the effective implementation of

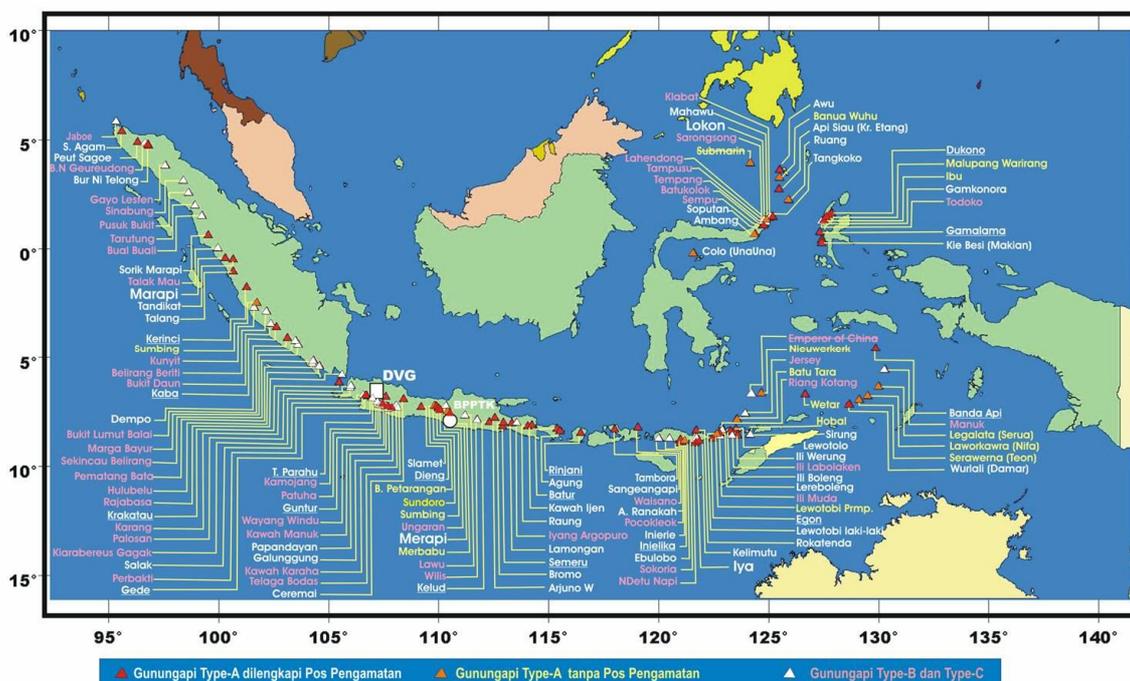

the HFA. These findings were presented in the Global Platform for Disaster Risk Reduction in 2009 in Geneva.

The target areas of the survey include Yogyakarta, Central Java, East Java, Aceh and Nias. Considering the time constraint, the total sample taken has been limited to 116 respondents, with 62 respondents from the local governments, 34 from the CSOs and 50 respondents from the community.

## II. Overview of Disaster Risk Reduction in Indonesia

Indonesia is an archipelagic nation extending 5,120 kilometers from east to west and 1,760 kilometers from north to south. It encompasses an estimated 17,508 islands, only 6,000 of which are inhabited. The country has five main islands; Sumatra, Java, Borneo (known as "Kalimantan" in Indonesia), Sulawesi and Papua; two major archipelagos (the Nusa Tenggara Islands and the Mollucas Islands); and sixty smaller archipelagos. Indonesia is located in the Pacific Ring of Fire, so it has many active volcanoes that are considered as the most active in the world.

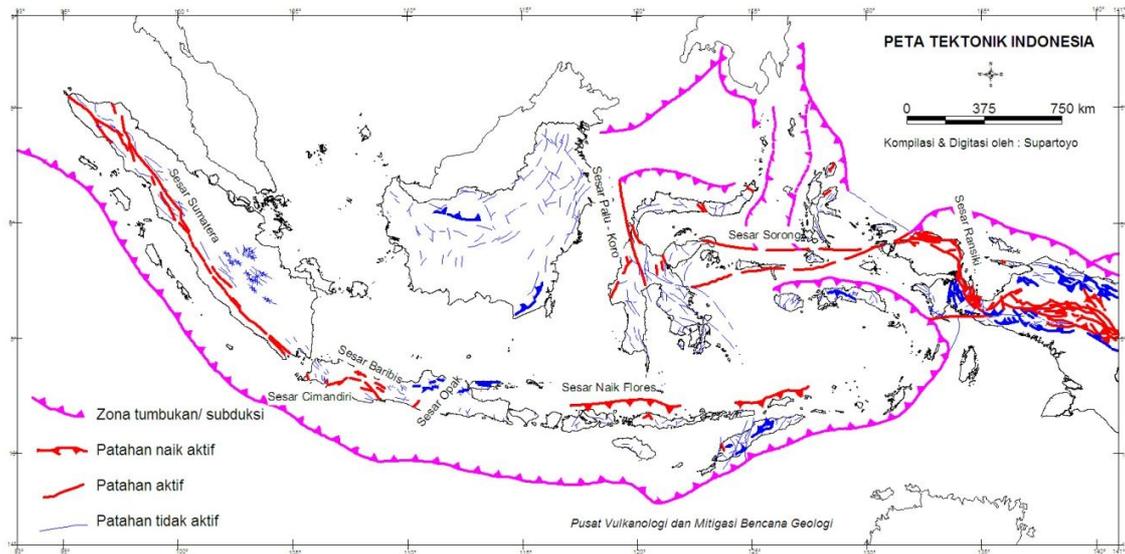

Figure 3: Map of Volcano Distribution in Indonesia

Source: Center for Vulcanology and Geological Hazard Mitigation (PVMBG), 2007

Indonesia also has four major tectonic plates that are thrusting into each other, i.e. the Eurasian plate that moves southeastward with a speed of 0.4 cm per year, the Indo-Australian plate that moves northward with a speed of 7 cm per year, the Pacific plate that moves westward with a speed of 11 cm per year and the Philippines plate that moves northwestward with a speed of 8 cm per year. This condition makes the country prone to earthquake hazard. An earthquake that occurs in the sea may trigger a tsunami threat, so in this case Indonesia is also prone to tsunami. The following figure presents the map of tectonics and distribution of active faults in Indonesia.

Figure 4: Map of Tectonics and Distribution of Active Faults in Indonesia

Source: Center for Vulcanology and Geological Hazard Mitigation (PVMBG), 2008

In addition to facing geological hazards, Indonesia also faces increasing incidences of hydro-meteorological hazards in line with the global climate change. Nearly every year many big cities in Indonesia like Jakarta, Bandung, Semarang and several others face annual flooding. The below table presents big disaster incidences in Indonesia in the past several years. Series of disaster that hit Indonesia in the past several years could be seen in Annex 1.

### III. ANALYSIS OF DATA

#### 1.0 PRIORITY FOR ACTION 1 – GOVERNANCE

##### 1.1 Overall Scores

**Table 1: Average Score for Priority 1 – Governance**

Governance				
	Local Government (LG)	Civil Society (CSO)	Community Representatives (CR)	Average
Framework and Structures	3.3	2.8	3.1	3.1
Planning	3.0	3.3	-	3.1
Right to Participation	-	-	2.7	2.7
Financial Resources	2.6	2.4	2.4	2.5
Financial Resources (or Partnership)	2.3	-	-	2.3
Human Resources	2.7	3.2	3.6	2.8
Schools and Health	-	-	2.4	2.4
Average	2.7	2.9	2.8	2.7

In General, the availability and accessibility to financial resources constitute the biggest challenge in the governance of DRR initiatives at the local level. Although the framework and structure have been there, it is realized by all partners that much work still has to be done in order that DRR initiatives may become effective at the local level. There is no significant difference between the average scores in DRR governance at the local level from the government, Civil Society Organizations and the community.

##### 1.2 Highs and Lows

At the government level, there is a gap between regulation and implementation. Disaster issue is belated to be common issue and addressed belatedly by government after massive disaster struck Indonesia. Government still considers Disaster Management as Emergency Response. Contingency fund is available in local government budget, but there is no funds allocated for Disaster Risk Reduction for local government.

CSOs pay high attention to planning because they are faster in accessing and accepting new issues compared to the government, partially because of their mandate for community empowerment. Planning becomes first priority because CSOs are more likely to have process-based orientation rather than result-based orientation. However, CSOs have limited financial resources due to their dependency on the donors.

The community has quite high human resources because they attained education and capacity building from both the government and CSOs. Access to government funds is limited, because the planning and implementation of DRR programs are conducted exclusively by the government. It is also necessary to pay attention to the governance of DRR in schools and health institutions due to its limited implementation.

### **1.3 Recommendations and Best Practices**

#### **Recommendations:**

- Build common understanding of DRR. Paradigm shift from emergency response to overall cycles of Disaster Management (Mitigation, Preparedness, Emergency Response, and Rehabilitation)
- There needs to be an agreement on the different states of disaster and an agreed disaster response mechanism with clear distribution of roles
- Dissemination of the DM Law, formulation of local DRR policies, mainstreaming of DRR perspective into local development planning and budget and ensuring that the budget could be accessed and support facilities are available
- Integration of DRR perspectives into organizational strategic planning
- Accelerate the establishment of Local Disaster Management Agency and it is expected that the members of the governing body of this agency involve disaster survivors
- Development of inclusive multi-stakeholder DRR forums
- International humanitarian NGOs should refer to the Code of Conduct in doing their works. They need to be accountable in doing their work, so that their beneficiary communities will not become dependent on them

#### **Best Practices:**

- Conduct relevant capacity building for DRR, such as: information dissemination to raise awareness, SAR training, CBDRM training, Medical First Aid Training, empowerment of local cadres and Village DM task force, and disaster simulations
- Community's initiatives and self-help efforts in emergency response, such as: volunteerism
- Conduct national examination during Mount Merapi eruption, 118 Team (Emergency Department) conducting health service during emergency phase
- Partnership with donor agency (BRR, TTN, national platform, local platform, cluster, etc)
- Site plan eases evacuation
- Development of community based crisis center especially to contain violence in disaster areas

## **1.4 Conclusion**

In the event of disaster, the people become the first to suffer the impact and to launch emergency response, therefore the government and the other relevant parties should always strive to empower people at the local level. Even in a disaster situation the people still have their dignity and resources, so that they must be involved actively in disaster planning and decision making.

To create good networking, coordination and partnership, multi-stakeholder forums that involve the governments, CSOs and the community need to be established. In working with disaster survivors humanitarian workers need to be able to differentiate between actual needs and wishes, so that nothing will be wasted. NGOs should cooperate well with each other to avoid unnecessary conflict among the communities. The National Agency for Disaster Management should be neutral and able to play its intermediation role.

## 2.0 PRIORITY FOR ACTION 2 – RISK ASSESSMENT, MONITORING AND WARNING

### 2.1 Overall Scores

**Table 2: Average Score for Priority 2 – Risk Assessment, Monitoring and Warning**

Risk Assessment, Monitoring and Warning				
	Local Government	Civil Society	Community Representatives	Average
Disaster Risk Assessment	2,7	3,3	3,2	3,1
Early Warning Systems	2,4	2,7	2,5	2,5
Risk Management Systems	2,6	3,1	-	2,9
Average	2.6	3.0	2.8	2.8

From the table, the three groups are strong in Disaster Risk Assessment and low in Early Warning System. It shows that emergency response paradigm is still quite strong, and preventive measures are overlooked.

### 2.2 Highs and Lows

The government needs to work hard to realize the paradigm shift from emergency response to disaster risk reduction. Even in emergency response, the score for risk assessment, monitoring and warning and disaster risk management is the lowest amongst the three groups. This indicates weaknesses in the implementation of disaster risk reduction paradigm.

Meanwhile, CSOs show better scores for risk assessment, monitoring and warning and disaster risk management. Yet, it is essential to scrutinize the sustainability in these areas because CSOs are limited to project and short-term activities.

The Community has its own indication in risk assessment and warning. It is commonly believed that community has local wisdom and knowledge in early warning system, but it is considered as not sufficient.

### 2.3 Recommendations and Best Practices

**Recommendations:**

- The government needs to ensure that information is accessible for community and information systems (communication networks) provide valid and accurate information
- The people need to be involved in disaster management including in the collection of accurate and effective data
- The government needs to follow-up of risk mapping with the integration of DRR perspectives into local government development planning, ensuring accessibility of budget and providing support facilities
- Applying tolerance principle and information transparency in collecting, gathering, analyzing and verifying data in the field
- Improving multi-stakeholders coordination system and updating 3W map (Who, What, Where)
- CSOs should give intensive assistance and recommendation to enhance risk assessment and ensure follow up
- Develop simple but effective EWS and providing support facilities needed

**Best Practices:**

- Cross sectoral partnership in making risk assessment
- Verify data to head of sub-village
- Updating of information in disaster prone areas from village apparatus
- Community reported emergency situation to village apparatus
- EWS using local wisdom (Example: Kentongan)
- CSO staff is adaptive to local culture.
- CSOs conduct participatory risk mapping and formulate strategic action planning with community
- Evacuation routes are in place
- Build houses in compliance with building codes and earthquake resistant standards

**2.4 Conclusion**

DRR initiatives should be done by all stakeholders, including disaster risk assessment, early warning system and disaster risk management. Development of EWS needs to be a key priority, because Indonesia is located in disaster prone areas. Since community is directly affected by disaster, building a community-based EWS is a must. Institutional system, educational and regulatory framework should become significant components of DRR. The recommendations and best practices show that there is still much work to be done.

### 3.0 PRIORITY FOR ACTION 3 – KNOWLEDGE AND EDUCATION

#### 3.1 Overall Scores

**Table 3: Average Score for Priority 3 – Knowledge and Education**

Knowledge and Education				
	Local Government	Civil Society	Community Representatives	Average
Information Management and Exchange	3	3	2.4	2,8
Formal Education (curriculum)	1,3		1.8	1,6
Formal Education (Training of Teachers and Materials, Training of staff)	1,4	3.2		2,9
Public Awareness and Understanding	2,8		2.7	3.0
Community Training	2,9	3.4	2.6	2.7
School Safety			2.7	2.7
Average	2.3	3.2	2.4	2.5

In this priority, CSOs has the highest score because they conduct many training programs and information dissemination. The community maintained that information and education provided by the government is limited. The government admitted that not many activities were done because they were not programmed and hence received no budget allocation.

#### 3.2 Highs and Lows

Availability of information system and database are government obligation. Therefore, multi-stakeholders have official reference to conduct multi-disciplinary analyses to strengthen planning and development at the local level. Yet, it is late for the issue of disaster to be turned into a common issue; disaster information has yet to be integrated into formal education system (the curriculum).

The main targets and goals of CSOs are not to build physical infrastructure because it is the responsibility of the government. The CSOs consider the communities as subject/actors in development, so development needs knowledge base, critical capacity and team work, and capacity development to nurture self-sufficiency and sustainability. Civil society organizations commence its work by conducting need assessment among their target beneficiaries. The data and information collected are then analyzed and processed to guide their strategy and working procedures. The need assessment and analysis process requires resources (knowledge, human resources and materials) that are not small. This need for big resources will make CSOs dependent on Donors' assistance and hence make them vulnerable to Donors' interventions.

Some communities have possessed local wisdoms related to preparedness from their ancestors for generations, but these were not well documented. Since this knowledge and information were obtained from their daily life and customs, it was difficult to develop them into a scientific body of knowledge to be taught through the formal education. As a result, many people in the community know little about disaster preparedness.

### **3.3 Recommendations and Best Practices**

#### **Recommendations:**

- Continuous information dissemination and education to all elements of the society
- Well-organized and systematic capacity building for DRR for communities living in hazard prone areas
- Program sustainability through empowerment of local cadres
- Infrastructure rehabilitation (public and educational facilities)
- Improvement of multi-stakeholder coordination by updating 3W map (Who, What, Where)
- Integration of DRR education into school curriculum
- Development of valid and updated disaster database
- Allocation of budget and funds for disaster risk reduction
- The government should ensure that information is accessible for community and information systems (communication networks) provide valid and accurate information
- CSOs and community should advocate government to mainstream DRR program into their development work plan
- In addition to providing assistance, NGOs also need to educate and develop the capacity of the community
- The media and press community needs to be independent and transparent in covering disaster news, so that coverage of disaster may be educational and help boost efforts to build preparedness in the future
- It is expected that the mass media will not only expose the miserable plight of disaster survivors, but also demonstrate the efforts of the community in accelerating their own recovery and in disaster management in general

#### **Best Practices:**

- Cross sectoral and multi-stakeholder partnership in giving education and capacity building for DRR
- DRR education is integrated into extra-curricular activities
- Strong regulation (Disaster Management Law)
- Sufficient human resources with skilled cadres in realizing the culture of safety and self-sufficiency

- Information dissemination through radio, pamphlet, brochure, etc.
- Radio broadcast during emergency phase
- Program is involving all community elements
- Competent staff and empowered local cadres for program sustainability

### **3.4 Conclusion**

Effort to raise the community awareness of DRR is highly needed. The media and press community needs to be transparent, independent and empowering in covering news related to disaster and its handling. The government should work together with CSOs and donor agency and support each other to provide support facilities, accessible budget, and DRR mainstreaming in development planning to this priority (knowledge and DRR education), so that disaster management can be done in a comprehensive, holistic and integrative manner.

## 4.0 PRIORITY FOR ACTION 4 – UNDERLYING RISK FACTORS

### 4.1 Overall Scores

**Table 4: Average Score for Priority 4 – Underlying Risk Factors**

Underlying Risk Factors				
	Local Government	Civil Society	Community Representatives	Average
Environmental and Natural Resource Management	2.9	3.4	2.5	2.9
Adaptation to Climate Change	2.9	3.7	3.2	3.2
Food Security	2.9	-	3.3	2.6
Social Protection	3.1	-	2.4	2.8
Economic Protection	3.1	-	2.1	2.6
Poverty Alleviation	2.3	-	2.4	2.4
Land Use	1.3	-	-	1.3
Urban Planning	1.3	-	-	1.3
Overall Planning	1.3	-	2.6	2
Building Codes and Standards	1.2	-	2.7	2
Building Codes and Standards (Enforcement)	1.7	-	-	1.3
Protection of Critical Public Facilities	3.8	3.2	3.2	3.4
Public-Private Partnerships	2.5			2.5
Average	2.3	3.4	2.7	2.3

The difference between the averages of the three respondent groups is a bit substantial, with the Government has the lowest score because not all underlying factors are addressed properly, particularly related to land use, urban planning and enforcement of building code. The CSOs show more sensitivity and concerns to the underlying risk factors. Meanwhile, the community is dependent on the stimulation provided by the government and CSOs.

### 4.2 Highs and Lows

#### **Government**

The government has built a lot of public facilities and infrastructure but the maintenance is still not optimal. The government mentions that “in general the communities facilitated have limited awareness in the management and conservation of the environment. The people will become aware of disaster after the occurrence of disaster, and preventive and anticipatory measures are lacking.” Government policy on environmental management is often directed to increasing state’s revenue only, without due consideration of environmental conservation. Job creation and economic development efforts seldom consider the balance between government’s interests and environmental conservation.

External investors often damage the environment and disrupt the social order of the society.

### ***Civil Society Organizations***

CSOs have conducted many for campaign and public awareness activities because CSOs tend to be quicker in accessing and accepting new issues than their government counterparts, and probably also because CSOs have the mandates to empower the community.

### ***Community***

The community admits their limitations in terms of the knowledge about environmental conservation and management. The government should also consider the fact that the information they provide to the community often is too limited. The community also faces the growing pressure of the economy. To build an empowered community, poverty alleviation and economic protection should be promoted more by the government.

## **4.3 Recommendations and Best Practices**

### **Recommendations:**

- Formulate specific local regulations for land use in disaster prone areas
- Define the level of authority of each stakeholder
- Integrate building codes and DRR policies into urban planning
- DRR mainstreaming program in every department and allocate funds for DRR
- Conduct regular coordination with stakeholders
- Promote community participation and self-reliance (for example: through the empowerment of the people's economy)
- Optimize existing assets and the environment. Raise awareness and build capacity for environment-friendly livelihood and environmental conservation
- Integrate sustainable environmental conservation into CSOs program
- Newly-built companies need to conduct rigorous and comprehensive risk assessment, so that they will not pose danger to their surroundings. Companies should be limited in exploiting the environment and required to nurture local entrepreneurship and promote solidarity through their Corporate Social Responsibility programs.
- increase social, economic and environmental quality in disaster prone areas

### **Best Practices:**

- The availability of development plan

- The government needs to invigorate traditional markets and limit the building of new super malls
- “Go Green” initiatives promoted by the community
- Build houses accessible for the diffable
- Build temporary barracks during emergency
- Dissemination of DRR paradigm and concepts
- Build earthquake resistant schools in rehabilitation
- Preservation of local culture related to environmental conservation
- Eco efficiency by minimizing NPO (non product output) waste environment-friendly products

#### **4.4 Conclusion**

It cannot be denied that man-made disasters occurred more frequently than natural disasters. Special attention needs to be given to natural and non-natural resources management to prevent man-made disasters. Development planning should consider hazard and risk factors, DRR regulations, building codes and standards, local wisdom and environmental and social protection. This is necessary to reduce vulnerability and avoid over-exploitation of resources and development that is destructive.

## 5.0 PRIORITY FOR ACTION 5 – DISASTER PREPAREDNESS AND RESPONSE

### 5.1 Overall Scores

Table 5: Average Score for Priority 5 – Preparedness and Response

Preparedness and Response				
	Local Government	Civil Society	Community Representatives	Average
Disaster Preparedness Capacities (Future Risks)	3.2	2.8	3.1	3.0
Disaster Preparedness Capacities and Response Planning	2.0	2.6	2.7	2.4
Disaster Preparedness and Response/Recovery	2.4	3.1	2.7	2.7
Training Drills and Rehearsal (LG) (CR)	2.9	3.7	2.9	3.2
Financial Reserves and Aid (LG) (CSOs) (CR)	3	2.6	3.2	2.8
Coordination and Information Exchange (LG) (CR) (CSOs)	2.4	3	2.7	2.9
Average	2.6	3	2.9	2.8

Preparedness and response of the government is the lowest (average 2.6) compared to the other groups, while CSOs have the highest score. All the three groups believed that although emergency preparedness and response training and simulation have often been conducted, the lack of facilities, infrastructures and resources still hinders the effort to build the capacity for disaster preparedness and response.

### 5.2 Highs and Lows

The Government has quite good capacity for emergency response, as can be seen through the organizational structure (command system) from the national to the local levels. However, standard of emergency response mechanism is not yet established affecting the speed and effectiveness in responding to an emergency situation. Also, the government still needs to increase its facilities, budget and resources.

The CSOs have high scores in training and simulation due to their commitment for capacity building, openness to new issue and easy to affect changes. On the other hand, CSOs' activities are often limited by their ability to raise funds to finance their programs.

Social capital such cohesion, tolerance, mutual cooperation and experiences in facing disasters become valuable assets. Physical assets such as emergency equipment are also available, provided by the government and CSOs. Improvement on coordination and information exchange, and relevant capacity building are highly needed for future response.

### **5.3 Recommendations and Best Practices**

#### **Recommendations:**

- Capacity building for CSOs staff, local cadres, and government staff in operational level is highly needed
- Provision of emergency equipment to support DRR initiatives
- Build constructive coordination and discussion and improve communication software and hardware for better coordination and communication exchange in disaster management
- Consider local wisdom in building preparedness
- Stimulate advocacy efforts to integrate disaster education into the national curriculum
- Government needs to involve CSOs and community in developing local action plan for DRR
- Government should open optimal access for vulnerable group in accessing government budget for DRR
- Information dissemination and socialization of Disaster Management Law and other DM policies

#### **Best Practice:**

- Formulate response mechanism standards that involve multi-stakeholders based on emergency response experiences (coordination, fundraising done by electronic media, community contribution (social capital) to improve the quality of future response and risks reduction
- Raising awareness and education on disaster management
- Cross-sectoral and stakeholders coordination

### **5.4 Conclusion**

In responding to any emergency, there is common vision and mission amongst the three groups, the government, Civil Society Organizations and the community. Therefore, the planning, implementation, monitoring and implementation of disaster management should be done together to improve its quality.

## 6.0 CROSS CUTTING ISSUES

### 6.1 Overall Scores

**Table 6: Average Score for Cross Cutting Issues**

Cross-cutting Issues				
	Local Government	Civil Society	Community Representatives	Average
Community Participation and Information	3.3	3.4	2.2	2.8
Actual and Fair Participation	2.9	3.1	1.9	2.4
Actual and Fair Participation (Local Organizations)			2.3	2.3
Volunteering			2.8	2.8
Encouraging Volunteers	3.3			3.3
Training Activities	3.0	3.5		3.2
Gender	2.7	3.2	2.8	2.9
Gender (Resources)	2.8	3.5		3.1
Cultural Sensitivity (Diversity)	3	3.4		3,2
Cultural Sensitivity (Traditional Knowledge)	2.9	3.7	3.3	3,3
Cultural Sensitivity (Languages)	3.1	3.5	3.3	3,3
Average	3	3.4	2.7	3.0

There are 11 cross-cutting issues in DRR. Civil Society Organizations have addressed most of these (average 3.4 – a substantial difference with the scores of the Government and the community). It is interesting to note that the government does not pay attention very much to gender issue, while addresses much the issues of participation and provision of information, as well as supports the involvement of volunteers in disaster management.

On the other hand, for CSOs and the community, participation in DRR initiatives, particularly by vulnerable groups, scores very low. CSOs and the community emphasize the importance of local culture, such as local wisdom and local languages in the implementation of DRR initiatives at the local level.

### 6.2 Highs and Lows

#### **Government**

In giving space for participation and information, the government has strong commitment, but still weak in implementation. It can be seen in the access to information and existing mechanism for budgeting. The effort to promote the

involvement of volunteers has been quite big, as can be seen in the mobilization of cadres, boy scouts and emergency response taskforces. Gender mainstreaming, however, still needs more attention. The government believes that weakness in gender mainstreaming has been caused by the low awareness and the level of education of the community.

### ***Civil Society Organizations***

CSOs have strong local culture sensitivity which is used as an approach in implementing DRR initiatives in order to receive positive acceptance and feedback from the community. Cross cutting issues is a commitment in DRR mainstreaming and addressed properly in the implementation. However, CSOs need to encourage community participation more.

### **Community**

The Community also has strong cultural sensitivity. Community as a social entity possesses social capital such as: tolerance, solidarity, mutual works, and the like, which become a valuable capacity in disaster management. Social values are strongly used by community in social interaction, but it is a challenge for them to actualize themselves and to actively participate in cross cutting issues, and this area receives the lowest score.

## **6.3 Recommendations and Best Practices**

### **Recommendations:**

- Integrate basic principles (participation, multi-culture and pluralism, gender, and other cross cutting issues) in disaster management works
- Capacity building for government in cross cutting issues
- Communication media should be available for sharing information on cross cutting issue
- Ensure that regulation is formulated for cross-cutting issues
- CSOs should assist government to formulate DRR regulations to fulfill public needs and build disaster resilient community
- The Government needs to be responsive to inputs and feedbacks (from community and cross-sectoral department)
- In DRR program and implementation, the government needs to engage in consultation with experts on cross cutting issues and implement the required capacity building
- Dissemination of information related to the cross cutting issues to the multi-stakeholders

### **Best Practices:**

- Updating of information and contextual issues in emergency situation
- Improvement of the quality of village development planning process by the participatory involvement of the community

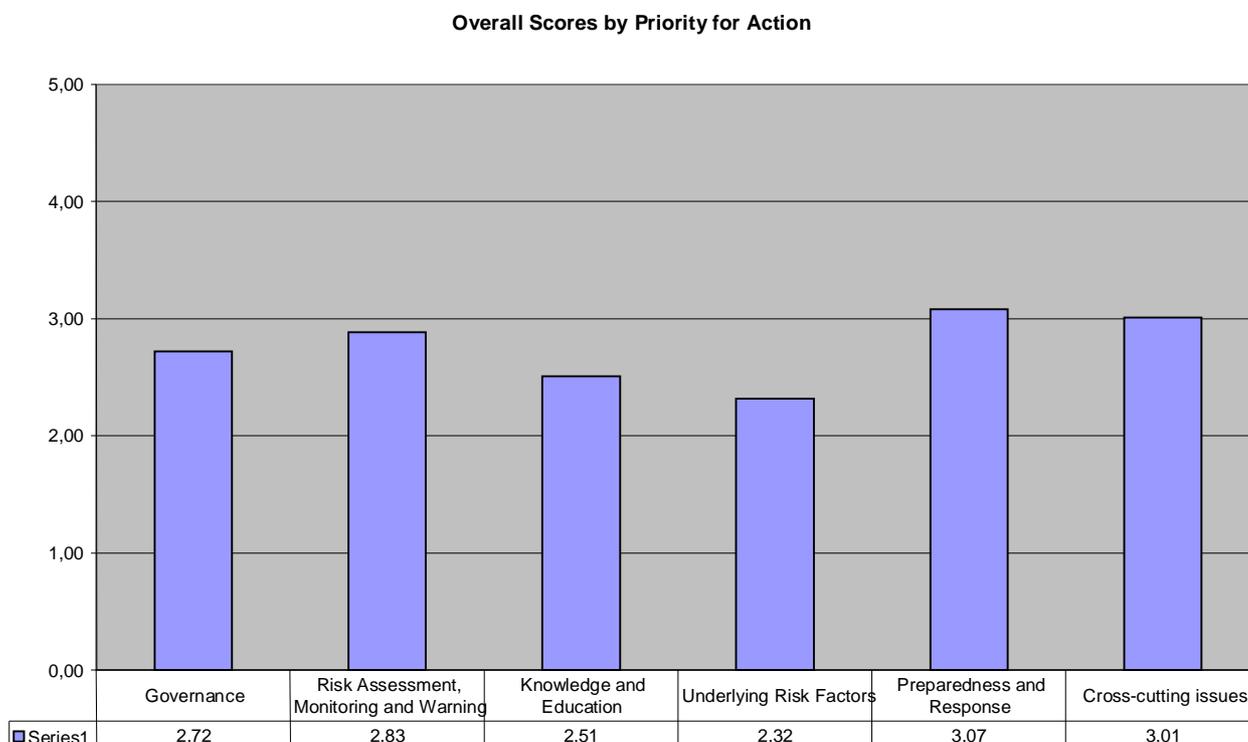

- CSOs conduct socialization on DRR and assist the government in developing DRR initiatives
- Sensitivity to local culture, social values, gender, religion and other aspects in socializing development planning and program

#### **6.4 Conclusion**

Cross cutting issues serve as a bridge toward comprehensive and holistic development. Cross cutting issues need to be considered as indicators in the planning, implementation, monitoring and evaluation of DRR programs. Multi-stakeholder forums are needed for information sharing and to raise awareness of cross cutting issues.

## IV. OVERALL HIGHS AND LOWS IN INDONESIA

Figure 5: Overall Scores by Priority of Action

### Governance:

The Law No. 24/2007 on Disaster Management has been launched and the National Agency for Disaster Management has been established. The Government has strong commitment to build disaster resilient nation and communities. However, a balance needs to be created between the regulations and their implementations. DRR perspectives and other key elements (cross-cutting issues, risks assessment, and underlying risks factors) need be integrated into all aspect of development and supported with sufficient budget and support facilities. For effective response in the future, standard mechanism for response needs to be formulated based on experiences of previous response.

### Risk Assessment, Monitoring and Warning:

The government seems to have much homework in realizing the shift of paradigm from emergency response to disaster risk reduction. The government and CSOs need to engage the participation and contribution of the public in assessing and monitoring disaster risks. Results of risk assessment need to be verified and updated regularly to ensure validity. Effective and simple early warning system based on local wisdom should be developed and provided to reduce future risks.

**Knowledge and Education:**

CSOs should assist the government and community in raising awareness, enhancing education and building capacity for disaster risk reduction. Access to information for community and multi-stakeholders forum are absolute needs, and should be available. Common understanding of DRR and multi-stakeholders forum and collaborative efforts amongst government, CSOs and community for DRR education and raising awareness are needed as the foundation for disaster resilient community and nation.

**Underlying Risk Factors:**

Some underlying risks have been addressed by government but not yet integrated optimally in development planning and implementation. Many campaign and public awareness activities have been done by CSOs because they are faster in accessing and accepting new issues compared to the government, and also because their mandate is to empower the communities. Efforts to empower community, alleviate poverty and protect the economy can only be done with the full support of the government.

**Cross-cutting Issues:**

The government has had a strong commitment to give space for public participation and to provide information, but is still weak in implementation. CSOs have had strong local cultural sensitivity in their DRR initiatives so that they are well accepted by the community and the community in turn gives their feedback to CSOs. Social values are strongly used by community in social interaction, but there is still a challenge for the community to participate more actively in cross cutting issues.

## **V. CONCLUSION, OVERALL RECOMMENDATIONS AND WAYS FORWARD**

### **Conclusion:**

The Government has strong commitment to build disaster resilient nation and communities. The Law No. 24/2007 on Disaster Management has been launched, and National Agency for Disaster Management has been established. However, this extensive process taken by Government on restructuring and refreshing/developing the policy in disaster management and disaster risk reduction are not always followed by parallel process in building the capacity of existing human resources, especially at the local level. There is a need to balance policy and its implementation. Civil Society Organizations need to assist the government and the community in raising awareness, educating and building the capacity for DRR.

DRR perspectives and their important elements (cross cutting issues, risks assessment, underlying risks factors) need to be integrated into all aspects of development. Access to information for the community and the presence of multi-stakeholder forums for DRR are indispensable. For effective response in the future, standard response mechanism needs to be formulated based on experiences from previous responses. Common understanding of DRR, an established response mechanism, multi-stakeholder DRR forums, mainstreaming of DRR into all development aspects and availability of budget and support facilities, as well as collaborative efforts amongst the government, CSOs and the community will lead to disaster resilient community and nation.

### **10 Recommendations from Indonesian Country Report**

1. Indonesia needs to build a common understanding of disaster risk reduction. The shift of paradigm shift from emergency response to disaster management (mitigation, preparedness, emergency response, and rehabilitation) needs to be socialized and internalized.
2. There needs to be an agreement on the status of disaster and an established disaster response mechanism commonly agreed by all, with clear roles and responsibilities of the government, civil society organizations and the community.
3. DRR perspectives need to be integrated into local government development planning, and supported by the availability and accessibility of budget as well as support facilities. The Government needs to open optimal access for

vulnerable groups in accessing government budget for DRR. The CSOs and the community need to advocate the mainstream of DRR into development plans in all sectors.

4. DRR perspectives need to be mainstreamed into the strategic plans of all organizations.
5. The local governments need to accelerate the establishment of Local Disaster Management Agencies at the provincial and district/city levels, involving disaster survivors as members of the governing body of the agencies, socialize Law No. 24 Year 2007 on Disaster Management and formulate local DRR ordinances.
6. Mechanism for inclusive multi-stakeholder DRR forums needs to be established and regular coordination conducted.
7. Valid and updated disaster database needs to be established.
8. The government needs to ensure that the community can access disaster information, and that the information and communication system (communication networks) provide only accurate and valid information.
9. Encourage community participation and self-reliance, including in the provision of emergency equipment (for evacuation and SAR) and support facilities to promote DRR initiatives.
10. Promote advocacy efforts to mainstream disaster risk reduction education into the national curriculum.
