### Synopsis

One of the emerging reasons for the current trend of increasing impacts of disasters is the unpredictability of natural hazard events, coupled with the tendency of human settlements to move to vulnerable locations including coastal areas, in search of economic gains. Urban areas are most affected due to concentration of habitat and resources. Whilst it is impossible to make urban growth resistant, resilience is becoming more widely accepted and urban systems must be resilient enough to cope with the climate-related hazards.

This book highlights the issues of resilience through regional, national, city and community-based studies. Contributions come from academia, city government networks, city managers, non-government

organizations and international agencies such as the World Bank and United Nations. Thus, the book reflects a unique aspect of a multi-stakeholder perspective. It also highlights how to enhance actions at local levels, and how the plans can be implemented through multi-stakeholder collaboration.

This is the first book to combine academic research and field practice in urban risk reduction, focusing especially on climate-related disasters in the Asian region.
